

BRSR filing, made simple with AI.

Redesigning how Indian listed companies prepare their annual sustainability report – from a spreadsheet-and-email scramble to a guided, four-step workflow.

- Product design
- AI UX
- Enterprise SaaS
- Design system

ROLE	USERS	SCOPE	DELIVERABLES
Product designer — research, UX, UI, prototype	ESG head, data owners, CFO, external assurer	Data collection, live E/S/G calculations, review, report, AI assistant	Research synthesis, design system, 5-iteration hi-fi prototype

One report, ten departments, hundreds of data points — and a deadline.

CHALLENGE	APPROACH	RESULT
BRSR is structured for regulators, not for the teams who own the data. Values are re-entered across disclosures, calculated by hand, and approved over email with no clear audit trail.	Mapped every BRSR question to its raw data point, regrouped them into 10 department-owned themes, and added an AI layer that flags, estimates and drafts — always with a human approving.	A four-step product — Home, Collect, Review, File — where each value is entered once, every disclosure calculates itself, and approvers start from what needs their attention.

A mandatory report most companies still build in spreadsheets.

Who files	Listed companies in India
How often	Every financial year, with prior-year comparison
Who's involved	EHS, HR, Finance, Legal, Company Secretary, ESG team, CFO, assurer
Today's tooling	Spreadsheets, email threads and external consultants

The form is built for regulators — not for the people who fill it.

01 Not grouped by owner	02 Asked twice	03 Hard maths	04 Blind review
Questions follow Sections A, B and Principles 1–9 — not the teams that actually own the data.	Electricity, headcount and turnover reappear across many disclosures and get re-entered each time.	Emissions, intensities and safety rates are calculated by hand — the main source of errors.	Approvals happen over email; nobody knows which questions it feeds and is reused.

...let each department enter its numbers **once**, have every disclosure calculate itself, and give approvers **confidence** before filing?

Four roles, four very different jobs.

DO	EH	CF	AS
Data owners EHS, HR, Finance, Legal	ESG head Owns the filing end-to-end	CFO Final internal approver	Assurer External verification
Needs to Enter only their team's numbers, quickly, without learning the BRSR structure.	Needs to See what's blocking the filing, chase owners, and review values with context.	Needs to Approve with confidence, starting from flagged values rather than the whole sheet.	Needs to Trace every reported number back to its source, formula and approver.

Five insights that shaped the product.

INSIGHT	RESPONSE
01 Questions follow regulation; data follows departments.	Regroup into 10 themes, each owned by one team.
02 One raw value feeds many disclosures.	"Enter once" — each input shows which questions it feeds and is reused.
03 Manual calculation causes most errors.	Live, visible formulas with last year's value alongside.
04 Reviewers don't know where to look.	AI flags large year-on-year swings and gaps first.
05 Four roles, four different jobs.	A role-aware home that shows only your next actions.

Powerful tools exist — none are built around how Indian filers work.

Category	BRSR-native	Enter once	Auto-calculate	AI review
Global enterprise suites Salesforce, SAP, Workday, Samsung SDS	Partial	Partial	Yes	Partial
India-focused ESG tools BRSR reporting software	Yes	No	Partial	No
Spreadsheets + consultants Still the default	Manual	No	No	No
Verdant	Yes	Yes	Yes	Yes

Five iterations, from structure to simplicity.

V1 Structure	V2 Restyle	V3 Clean SaaS	V4 AI layer	V5 - Final
Themes, enter-once inputs, live formulas, 4-role approval	Moved from a wireframe aesthetic to familiar components.	Readiness ring, approval pipeline, charts, data checks	Briefing, flags, estimates, drafted narratives, assistant.	Four steps, a command bar, one-click actions.
Provided the information model before any visual design	Lowered the learning curve for non-specialist data owners	Gave the ESG head a live view of progress	Shifted effort from finding problems to fixing them	Cut navigation down to the path every filing takes

AI says what matters — then does it in one click.

Briefing	Ask or act	Next actions
Personal briefing Opens with what's waiting for you: themes to review, values flagged, and filing readiness.	Command bar One input for questions and commands, with suggested prompts for common tasks.	Next actions, inline Missing values can be filled from last year's trend — tagged for verification.

Grouped by theme. Entered once. Calculated live.

Traceable	Transparent	Efficient
Feeds shown on every input Users see exactly which BRSR questions a value fills.	Formulas in the open Scope 1, 2 and intensity figures recalculate as you type.	Confirm, don't re-check AI flags savings over 25%; confirming takes one click.

Approvers start with the flags, not the spreadsheet.

Approval pipeline with AI flag counts on every card, and an audit trail for assurers.

The BRSR writes itself — in the regulator's order.

Approved values flow straight into Sections A–C. AI drafts each section's narrative from live data, clearly marked "review before filing", with PDF and XBRL export.
--

AI suggests. People approve.

One consistent AI signal	Estimates stay tagged
A single + mark and amber colour identify everything AI produced, so it's never mistaken for verified data.	Trend-based estimates remain marked until a data owner verifies them.

Narrative, not final copy	Always explainable
Narratives are labelled "review before filing" and can be regenerated as data changes.	Every figure can be explained — its formula, its inputs and who approved it.

Calm surfaces, precise numbers, one AI signal.

From a regulatory questionnaire to a four-step workflow.

10	1×	20+	4
department-owned themes replace a regulator-ordered questionnaire	every value entered once and reused wherever it's needed	E, S and G metrics calculated live with viable formulas	steps from first data request to a filed report

Time to file	Auto-fill rate	Review efficiency
Days from the first data request to an approved, exported report.	Share of BRSR questions answered automatically from entered inputs.	Values returned to owners, without many of those were caught by AI flags first.

Success metrics proposed for validation with real filers.

What I learned, and what's next.

What worked	What I'd do differently	Next steps
- Getting the information model right in V1 made later visual rounds faster. - Showing what each input "feeds" made the enter-once idea instantly clear.	- Bring AI into the prototype earlier, to test trust signals sooner. - Simplify sooner — V5 removed more than it added.	- Usability testing with ESG teams at listed companies - Measure time-to-file and auto-fill rate against a spreadsheet baseline. - Validate the competitive assessment through product demos.

Thank you.
